

Lincoln County, NC
COVID-19
SNAPSHOT XII

We are seeing a second wave of cases for Lincoln County. Not alarming or unexpected, but still noteworthy. In the past 30 days, the total cases for ages 0-17 has experienced an 11% growth. However, there have been minimal cases needing hospitalization. New cases for all age groups are coming in more quickly with the test dates being closer to the reporting date. This is a contributing factor to the swell in active cases. The current average-case-per-day figure for the past 30 days is about 20. This is approximately a 53% increase from the 30 day window prior which had an average of 13 per day. The significant uptick in cases suggests we are definitely in a new “peak” or wave of resulted positives. We’ll continue to monitor over the next few weeks to see how Phase 3 and the percent of active positives have an impact on the health resources for the county. While this is always concerning, the continual transition back into routine activities will result in increased transmission. Therefore it remains important for everyone to consider personal responsibility within our community by continuing to use the appropriate control measures.

This graph shows the number of active and recovered case counts on a given date over a period of time.

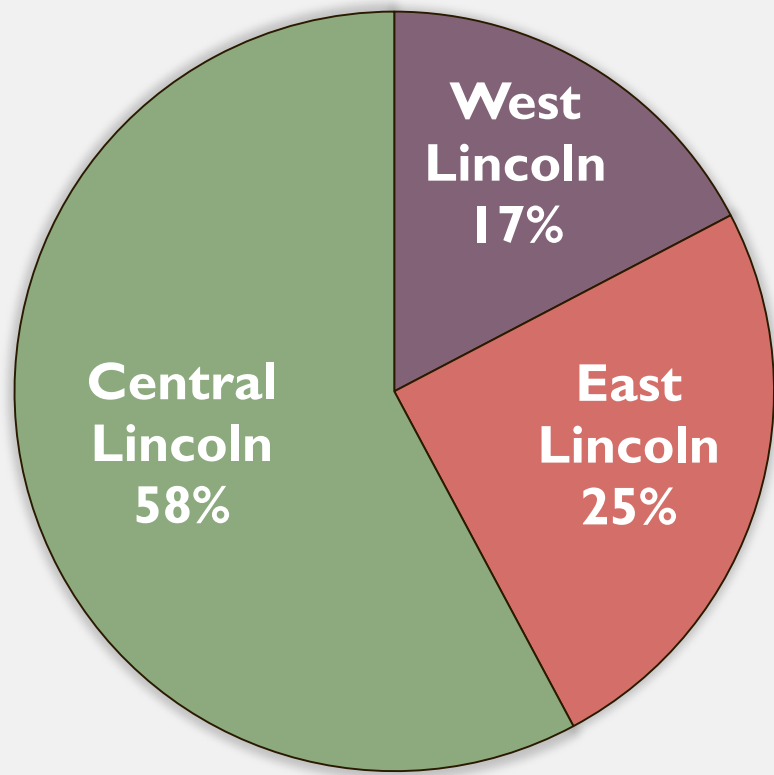

As we move forward with COVID, we will be using a *Moving Average* trend line rather than the previous polynomial curve. This doesn't change anything important in the purpose of the trend line other than a minor adjustment in the appearance and slight placement shift of the peaks. As the timeframe of case reporting continues for the months ahead during this epidemic, the moving average is simpler and establishes consistency with other reporting groups. We want the information to be easy to follow and familiar.
