

Lincoln county continues to see our most active degree of positivity to date. From the beginning of October, approximately 9.7% of diagnosed positives were between the ages of 0-17. A slight decrease in positives cases in this age demographic. In contrast, approximately 20.5% of the resulted positives were in the 65+ age demographic. This is a slight increase in positive cases for seniors. As we endure this next transition in case positivity, it is vitally important to continue to consider our activities and personal responsibility to help reduce and control the risks associated with transmission of Covid-19. Continue to practice source control by wearing appropriate face coverings while in public or engaging in social activities, continue to be mindful of and practice adequate social distancing and wash your hands often!

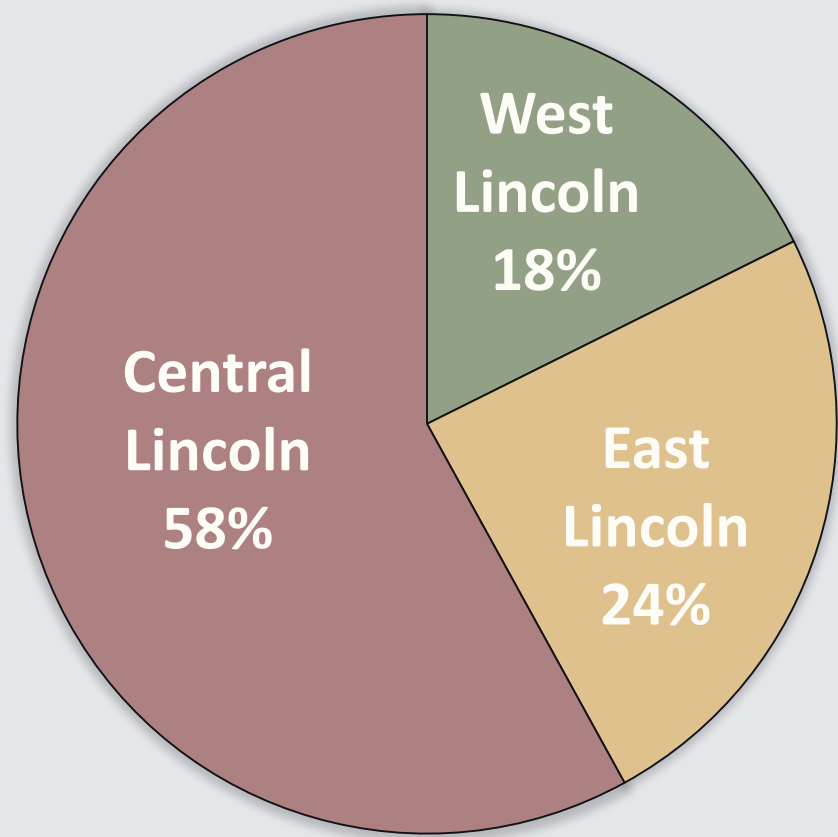

This graph shows the number of active and recovered case counts on a given date over a period of time.

As we move forward with COVID, we will be using a *Moving Average* trend line rather than the previous polynomial curve. This doesn't change anything important in the purpose of the trend line other than a minor adjustment in the appearance and slight placement shift of the peaks. As the timeframe of case reporting continues for the months ahead during this epidemic, the moving average is simpler and establishes consistency with other reporting groups. We want the information to be easy to follow and familiar.
